How do i delete a series priority on spectrum

Besides offering a wide range of cable TV packages, Spectrum TV also provides its customers access to viewing content that you record on the cloud. The app lets you record live TV, shows, schedule recordings, and more from its DVR box. The service also offers different packages that let you record TV programs so that you can view them at a later time on all your devices. In this post, we'll help you watch recorded shows on Spectrum TV, manage your recordings, prioritize them, and how you can delete shows after watching them on it. Watching recordings on Spectrum TV App Things are different when you want to watch recorded content on the Spectrum TV app on iOS, Android, Xbox One, Roku, Samsung Smart TVs, and others. You will have to subscribe to Spectrum's Cloud DVR (cDVR) and Cloud DVR Plus (cDVR Plus) services for \$4.99/month and \$9.99/month respectively for using the DVR service on iOS, Android, Xbox One, Roku, Samsung Smart TVs, and others. How to Watch Recorded Shows on Spectrum TV App You can watch recorded programs on the Spectrum TV app by accessing the 'DVR' option the app and then going to the 'My Recordings' option. When you select 'My Recordings', you will be able to view all the programs or series you might have recorded in the past inside this screen as well as the number of episodes of the show you have recorded. The same section can be accessed on Apple TV and Roku devices by going to My Library > Recordings. In the 'Recordings' screen, select the series or program you want to watch on your device. On the next screen, you will be shown all the episodes that were recorded from the selected series. Choose the episode you want to play. Tap the 'Play' button on the screen to start watching the show that you recorded on the Spectrum TV app. How many streams can you watch at a time on Spectrum TV app? No matter which Cloud DVR package you're subscribed to, Spectrum allows you to watch unlimited number of streams at once if you're streaming them on home WiFi. However, there's a limit to the number of streams if you're on the go. You only have access to 3 concurrent streams per account using the Spectrum TV app. If you go beyond this limit, an error code will appear on your screen. How many shows can you keep on Spectrum Cloud DVR? You can keep multiple shows and programs on Spectrum Cloud DVR so that you can watch them at a later time on the Spectrum app on your device. The number of shows that you can keep at once on Spectrum Cloud depends on the Spectrum cDVR package you're subscribed to. For cDVR: You can keep up to 50 shows for up to 90 days. For cDVR Plus: You can keep up to 100 shows for up to 365 days. Deleting Recordings on Spectrum TV app After you're done watching a show or an episode that you recorded on Spectrum, you can choose to delete it from your recordings. You can do so by either going to DVR > My Recordings or by selecting the program information page. From here, tap on the 'Delete Recording' option on the episode or show you want to remove. You will be prompted to confirm the removal process and once you do that, the selected program will be cleared from your recordings library. This way, you can clear space from your Spectrum's Cloud DVR library so that you may record more new content for future use. Watching recordings on Spectrum TV Box What do you need? To watch a show that you recorded on Spectrum TV, you need to make sure that you have the following things: Spectrum DVR subscription: You can only record and watch content on your TV if you have subscribed to a Spectrum DVR service. The service comes at a cost of 4.99 per month for a built-in DVR to be used in one HD-Box. Spectrum also allows you to use DVR on two or TV receivers for a flat \$9.99 per month. Spectrum DVR digital receiver connected to your TV: You can watch recorded content via Spectrum only if you have the Spectrum receiver plugged into your TV. The number of programs you save will depend on the recording capacities of Spectrum DVRs. It's important to know that you can save more SD recordings than ones in HD, as the latter takes up more storage. How to View your Recorded Programs on Spectrum Recorded programs on your Spectrum receiver can be accessed directly on your Spectrum remote. To watch recorded shows and programs, press the 'My DVR' or 'DVR' button on your Spectrum remote. You will be taken to the 'My DVR' screen on your TV. In this screen, click on the 'Recordings' tab from the left sidebar and you will be able to see a list of all the programs or series you might have recorded in the past as well as the number of episodes of the show that have been recorded. Select the series or show you want to watch from your recordings. On the next screen, you will see the list of episodes that have been recorded from the series you selected. Select the episode you want to watch from this list. When you click on an episode, you will be presented with a bunch of options. Click on the 'Watch' button to watch that particular episode of the selected series. The selected episode will start playing on your TV. How to Delete Recorded Programs on Spectrum TV after watching Once you have completed watching an episode from your recording, you can delete it so that you can preserve space for future recordings. Delete individual episodes You can remove the episodes that you have already watched by going to My DVR > 'Series name', selecting the episode you want to delete, and then clicking on the 'Delete Recording' button below the episode title. Upon doing this, Spectrum will delete the selected episode from your recordings. Delete all recorded episodes Spectrum also allows you to delete all the episodes of a series if you have already watched them or aren't planning to watch them in the near future. To delete episodes of a program or show on Spectrum, go to the 'My DVR' screen by pressing the 'My DVR' or 'DVR' button on your Spectrum remote. Inside the 'My DVR' screen, make sure you select the 'Recordings' tab on the left sidebar. You will be shown a list of shows and programs whose episodes you have recorded on your Spectrum receiver. In this list, navigate to the show you want to delete episodes from using your remote's D-pad without selecting it. Using your remote, select the 'Delete All' button adjacent to the series name to delete all recorded episodes of the selected program. How to Change Series Priority for scheduled recordings Spectrum offers you a smart way to record shows so that there are no conflicts when recording multiple shows at once. This is possible through the service's Series Priority feature which you can use to set different priorities to multiple series so that the ones in priority are downloaded first before the space or limit runs out. To change a priority for a program, press the 'My DVR' or 'DVR' button on your Spectrum remote. Inside the 'My DVR' screen, select the 'Series Priority' tab from the left sidebar. You will be presented with the list of ranking that is set for your recordings. To change a priority for a show, select the series whose priority you want to change by clicking on the 'OK' button on your remote. Now, move the series up or down the priority list using the up or down arrows on your Spectrum remote. Save your preference by pressing the 'OK' button again on your remote. You can repeat the steps for setting different priorities to the shows you've recorded. How to Manage your Scheduled Recordings on Spectrum You can manage all of your scheduled recordings on Spectrum to execute different options like canceling a recording, editing start and end times, and more. To manage your scheduled recordings on Spectrum, press the 'My DVR' or 'DVR' button on your Spectrum remote. Inside the 'My DVR' screen, select the 'Scheduled' tab on the left sidebar. Select the show or program you want to manage. To change the start and end times of a show, you can select the 'Edit Recording' option and follow the instructions on the screen. You can also cancel scheduled recordings for a show by clicking on the 'Cancel recording' option below the show title. How to Check your Spectrum DVR history You can check your recording history to see which shows have been recorded, their recording progress, programs that have been recorded successfully, and those that have been deleted from your recordings. Some programs will be shown as stopped or canceled, if there was a conflict while recording, or if storage wasn't enough, or if you intentionally canceled them yourself. To view your DVR history by pressing the 'My DVR' or 'DVR' button on your Spectrum remote. Now, go to the 'History' tab from the left sidebar inside the 'My DVR' screen and you will see a list of all the programs that you set for recording. But before we understand why OnePlus chose the n78 & n41 bands on its latest devices, we need to understand what 5G is all about & why you should care about it. So, right off the bat, 5G is one of India's most awaited network technologies. This superfast mobile internet connection promises to pave the path for some extraordinary advancements in technology. Given the 'awaited' status of this technology in India, there's a lot of half-baked information floating on the internet about 5G and speculation on how & when it will be deployed in India. So let's understand what this technology means, how it will impact our lives in the near future, and how you, the end-user, can reap its benefits when the technology is finally launched. What is 5G? In short, 5G is the 5th generation mobile network. It is a new global wireless standard that promises to connect virtually everyone and everything, including machines, objects, and devices. The smartphone you own probably has 4G, and the kind of internet speeds you get on your device right now will be minuscule compared to 5G. Theoretically, this technology promises to deliver higher multi-Gbps peak data speeds with ultra-low latency. Status of 5G in India! If you own a 5G capable smartphone right now, there's a good chance that you'll be able to experience 5G speeds by the end of this year. In fact, the Department of Telecommunications earlier this month gave the nod to Indian telcos to commence 5G trials for six months. The DoT has given a green signal to use different 5G band spectrums such as the mid-band (3.2-3.67GHz), the millimetre-wave band (24.25-28.5GHz) and the sub gigahertz band (700GHz) along with their existing spectra in the 800MHz, 900MHz, 1,800MHz and 2,500MHz frequencies, during a trial phase. So, 5G can be a reality in India very soon. What is 5G Band Spectrum? 5G band spectrum is essentially the frequency at which the internet speed will be available to your mobile device. To simplify, the band spectrum is divided into three significant tiers, low, mid and high (millimetre). A low band will cover any spectrum that is lower than 1 GHz on the spectrum chart. A low-band spectrum will allow the telcos to provide wide coverage. Sounds good? well, that's just one aspect of the story. A low band spectrum also means that the speed and latency of the 5G network will be marginally better than 4G. A mid-band spectrum that falls between 1GHz & 6GHz range. This is considered perfect for 5G deployment because it can carry plenty of data while travelling long distances. Another benefit of the mid-band spectrum is that telcos can use the existing 4G infrastructure to deploy the network. Now, the high-band spectrum, also known as the millimetre wave spectrum of the 5G network, falls very high on the spectrum chart in the 24 GHz band and higher. One major benefit of the millimetre wave spectrum is the signal can get you connection speeds between 1 Gbps to 3 Gbps &, in some cases, even higher. But there's a downside to this as well. The millimetre wave spectrum can't travel very far; in fact, these waves are susceptible to even minor interference such as trees and buildings and even glass. That means you need to stand near a millimetre wave tower without anything between you and the tower to get the best possible internet speeds. What'll you get when 5G is deployed in India? On paper, if your 5G capable mobile device has more bands, you will get a better 5G reception. But it all depends on your telecom provider, who needs to enable all the possible 5G band spectrum in your region. But that is not the case in India right now. As mentioned above, govt has given the nod to test the mid-band (3.2-3.67GHz), the millimetre-wave band (24.25-28.5GHz) and the sub gigahertz band (700GHz). The rate at which 5G will be deployed and start testing is up to Telcos. The most popular 5G band, which is also the commonly tested and deployed 5G frequency across countries with most of Europe and Asia, is the mid-band - 3.3-3.8GHz range. In fact, the majority of commercial 5G networks rely on the mid-band - 3.3-3.8GHz range as the lower cellular spectrum is already widely in use by 3G and 4G networks. The band n78 at 3.5GHz falls under the ambit of the bands that are expected to be made available in India upon the 5G rollout. This particular band - n78 - being a mid-band spectrum, offers a good mix of coverage and capacity benefits. In many countries, the n78 band's popularity is due to its relatively common availability, compared to the lower cellular spectrum (below 2700MHz) already widely in use by 3G and 4G networks. OnePlus 9 series of smartphones and 5G bands The network bands on the OnePlus 9 series are decided based primarily on the priority of Indian and global carriers for deploying 5G in India. This has been decided after closely working with telecom operators and stakeholders. OnePlus 9 series has two major 5G bands - n78 & n41. Given the popularity of the n78 band, telcos are likely to deploy the 5G network on this particular band. Hence, it was ideal for OnePlus to apply this band on the latest 5G smartphones. The idea is to make 5G available to the masses as soon as possible, so the path to achieving this is for the telcos to enable 5G on lower frequencies that allow a wider coverage. The 5G band n41 at 2.6GHz is another popular 5G band that can enable 5G to a large number of people. So if you own a OnePlus 9 series smartphone, you can experience 5G internet speeds when the networks decide to roll out 5G.
