Excel vba copy range to another sheet loop

Dear dear everything, I would kindly like to examine this problem and return to your first convenience. INPUTS (phone name) Problem # 1 Please refer to "BN" column in the Inputs sheet while the formulas are updated as text values, below is the code I used: sheets ("inputs"). Select Range ("A1"). Select Selection.end (XLtright). Select Range ("BN1"). Select ActiveCell.Formular1C1 = "Total" Range ("BN2"). Select Range ("BN2"). Formula = "= SUM (AN2 + AK2 + AL2 + AB2 + AD2 + Z2)" Range ("BN2"). Select Selection. Copy Range ("BM1"). Select selection.end (xldown) .offset (-1, 1) .Select range (selection, selection.end (XLUP)). Offset (1, 0). Select Selection.Pastespecial Paste: = XLPasteFormulas, Operation: = XLNONE, SkipBlanks: = FALSE, TRANSPORT: = Application of vial.cutcopyMode = Fake problem # 2: Now I wanted the entire "BO" column to be cut and glued with The values in the "A" column in the same Range sheet ("BO1"). Select Range (selection, selection.end (xldown)). Select Select.Cut Range ("BO1"). Select selection.end (xlifb). Select columns ("A: A"). Select columns ("A: A"). Select Selection. SHIFT insert: = XLtright Selection. Copy selection.Pastespecial paste: = XLPASTValues, Operation: = XLNONE, SKIPBLANKS : = false, Transposing: = Application of viala.cutcopyMode = false output (sheet name) sheets (input) .colo Bo (the number of rows it has value Various and then I created a loop that will run the macro until the active cell is empty). My macro starts from Range (BO2) and extends to the Bo column, stops only when it hits an empty line the desired result for the macro will be to start copying the value of the cell to sheet (input). Range (BO2) paste it to sheet (output) .range (A2: A10). For example, if "Peter" has been the value in the cell sheet (input), the range (BN2) then when the mark executes and paste the value in the sheet range (output) A10). IE Range A2: A10 reflecting "Peter" then the macro cycle returns to sheet (inputs) & copy the value of the next cell and paste it to interval (A11: A19) Example: "Dave" was the value in sheet (inputs) Range (BO3) So then it will paste into the next 9 rows in sheet (my work). Range(A11:A19). A11: A19 will reflect "Dave" Repeating the same process back to sheet (input) this time interval (BN4), copy the value goes to sheet (Output) and paste it into A20: A29. Basically the process repeats itself... Sub Button10_Click() Dim r MyCell As Range Dim Dim intMyLoopCount As Integer Dim wsInputTab as worksheet Dim wsOutputTab as worksheet application. ScreenUpdating = False Set wsInputTab = Sheets("Inputs") Name of the input sheet. Change to suit if necessary. Set wsOutputTab = sheets("Output") Exit sheet name. Change to suit if necessary. For each rngMyCell In wsInputTab.Range("BO2:BO" & wsInputTab.Cells(Rows.Count, "BO").End(xlUp). If Len(rngMyCell) > 0 Then intMyLoopCount = 1 Do Until intMyLoopCount > 9 wsOutputTab.Range("A" & Rows.Count). End(xlUp).Offset(1, 0). Value = rngMyCell intMyLoopCount = intMyLoopCount + 1 Loop End If the next rngMyCell Set wsInputTab = Nothing Set wsOutputTab = nothing Application. ScreenUpdating = True MsgBox "Done". End Since we have created 9 line articles (OUTPUT-A2:A10) on each input sheet line (BO2), now on default these lines to be populated based header names: The first 9 lines of each line article of "Inputs Sheet"(BO2) View Attachment 422150 Header name of the sheet = calculation of the formula ; Date of publication = Period A date + 1 day (H2 = Inputs!P2+1) Date of expiry = Period A Date + 30 days (I2 = Inputs!P2 +30) Next Reading date = Date to date + 30 days (O2= Inputs!P2+30) Price = From the output sheet only article Total /Quaintly (W2=A2/U2) -> Based on the heading column these rows should be updated as below IF text the heading column is Commodity = "Electricity IF the header column is Consolidated = False "IF the header column is Bundled = "TRUE" fcolumn header is Is Reversal = " False " IF the Column Heading is Is Final Bill = "Fal Conversion Column is the Dollar Dollar DollarThe column header is Å ¢ å,~ Å "Period Pro Rate = Å ¢ å,~ Å " 1Å ¢ If the column header is the actual reading = should recover from the input sheet (it is the voice actual reading), if it appears Å ¢ å,~ "should be updated with Å ¢ å,~ Å" false Å ¢ å,~ Å "or if it appears" effective Å ¢ å,~ å "than it should be updated with Å ¢ å,~ å "TrueÅ ¢ å,~" basically the process is repeated someone can help me on this and take this order and I also attached Excel sheet for your reference, your first support / response would really be Grateful. Many thanks in advance, I can't wait for your reply. Greetings, Hari Prasad B Your first answer would be really grateful. Last modification: September 30, 2015 I need the code from loop through the visible leaves of the workbook Current that are not called "contents" Copy values and conditional formats paste in another workbook (with name and known sheets already nom Use as the source) as values and sizes SourceWB is .XLSB Destwb is .XLS How is this? Sub Copysheets () Dim SourceWB as a DIM DT DTWB workbook as workbook DIM WS as worksheet Set SourceWB = Thisworkbook 'AssSume Destination Workbook is already open set Destwb = Workbooks ("Destwb.xls") Application.ScreenUpdating = false per Each WS in SourceWB.Worksheet 'controls the name of the sheet and make sure it is visible if ws.name "content" and ws.visible = true then ws.us.useprange.copy' paste values and formats for the workbook destination "Presume the destination workbook has already denominated sheets properly with Destwb. Worksheets (WS.Name) .range (" A1 ") .Pasterecial XLPastevalues å ¢
