If you have several cameras from different manufacturers and brands, it can be convenient to use the application so that the IP camera browser can search and check everything by phone. Using the application on a smartphone or tablet with Android, you can view live feeds from cameras, playback and grouping of cameras, access specific notifications and other regular settings. The only requirement is that all IP cameras, regardless of manufacturer, should support ONVIF or RSP/MJPEG stream. These protocols allow third-party software to access camera resources and send data to corresponding applications. In this manual we show free applications that can be used on Android smartphones and tablets. They are equipped with different features and functions and help you control all security cameras through an app. Our pick: IP Viewer -CAM Tincam Monitor The best browser -browser apps for our experience. Tincam Monitor is the best Android app to view ONVIF cameras. It has various basic and extended functions which can help in the exact use of the camera, has an intuitive surface and is beautifully designed. Moreover, the application is reliable, fast and responsive. We've been using this app for several years on various Android phones (and tablets) and there's never been a serious problem. The cameras are good and of good quality. The app can recognize and support over ten thousand different branded cameras and models. Use ONVIF protocol, streaming RSP streaming, etc. And it can transmit video channel without delay. In addition, the application in many Windows offers a department view, which means that it is possible to display many on-screen cameras connected in different configurations. The screen automatically changes to horizontal or vertical mode. The sample of how cameras appear in the app is shown below. Tincam Monitor is available in two versions, free with limited functions and a Pade version of Pro. Basic can work well if you're looking for something easy. However, the paid version offers additional functions and options capable of guaranteeing the advantage of security or business security. Moreover, the paid version is 5 USD and payment payment. It's not bad at all. You can use this app to see the live view of your cameras to view your property, to keep your children in mind, to use the playback, to use the traffic recognition function, etc.And responsive aS Supports thousands of models of IP cameras -a version for available at the price -unique payment -Cloud Recording Recording Oxcitation Movers and Face Movement ; Additional advanced features such as line crossing or detection of intrusion. This application is another solution to display mixed cameras on Android devices. However, the interface and layout of the application do not correspond to our favorite little bump. In general, the appearance of the application seems to be several years late. But ultimately it doesn't matter? The application does what it is supposed to do, displays the camera frame, reading and works properly. The cameras are easy to connect and the applications support ONVIF and RTSP streaming. In addition, the application can automatically detect and configure more than 1,800 cameras, regardless of the model or the brand. You can even add a NVR or a DVR. The application is available in two versions; Free supports advertisements and has limited features; The paid professional version does not distribute advertisements and has all the available features. Advantages: ✓ ✓ ✓ Support of a wide range of cameras models ■ Movement detection ■ Good price (unique purchase) ■ Support of the web server ■ Disadvantages: ■ Obsolete interface ■ Certain camera detection problems ; Functiones missing advances. This application is not very popular compared to the previous ones but still works well and does the work. The interface is passable, not good but not bad and easy to use. The application only supports basic features, but lacks advanced features such as bidirectional audio, web server, home automation, etc. The application is available in two versions; A version funded by advertising and a paid professional version with more features. In general, the application is reliable and does not slow down. Not a lot of features, however. Plusy: ✓ Easy to use application ✓ Supports many cameras ✓ The version has a high value (single purchase) ✓ Disadvantages more than 3 third -party devices using third -party devices, although there are different means, more reliable and professional As everyone views your cameras in one place, phones easily manage your cameras. However, there are advantages and disadvantages. The advantages include simple parameters, applications generally detect cameras automatically. In addition, these applications support onvif protocol and RTSP streaming, which allows you toDevices communicate (using these standards). Other positive things of these applications are their costs, relatively cheap and often buy without subscription plans. The list of disadvantages is somewhat supported by support for a limited number of channels. While NVR can control all the necessary cameras, these applications are limited by the number of cameras that show and support. In addition, only ONVIF/RSP can be connected to these telephone applications and require notes, since films can be stored in the application. In addition, you need a continuous connection to the Internet to avoid missed work and records. What functions are important in IP frames? It is important to automatically detect cameras, and this is important because many people are not technological experts. A good display of IP cameras should automatically detect a camera compatible with ONVIF. The application scans the network, finds the IP -address of the camera and, therefore, automatically sets it up. This function saves you too many headaches and time, you do not need to manually add an IP -address or enter doors. Let the application make. As already mentioned, this function works only with ONVI cameras. Support for IP RTSP IP cameras requires RTSP to transmit the RTSP protocol. RSP is a standard for the stream of video tied video. And all applications are the URL RSP URL and access information. Then, providing useful functions, such as the application, movement, activation, notification and notification, even more nourishing this video. Some IP cameras now provide P2P support in their cells. This means that each camera is determined by a unique number (for example, a standard number, device or UID). All you need to do is add this unique code to the application, and the camera will appear here. In addition, the use of P2P does not require routing on the router or any IP -address. All you need is the P2P code. Detection of movement and continuous recording are two important functions, and the whole purpose of the application is to maintain an important video for you. Detection of movement can be made on the camera. This means that the software for the camera detects movement and, therefore, sends a signal to the application. Or can be done within the application. In this case, the application shoots a video with a feed feed and, therefore, uses an algorithm to detect movement or use other intellectual functions. Some IP cameras have lower software and movement settingsYou can jump in seconds or activate movement. In practice, you may need to search for an application with a phone that can detect movement. In addition, some applications can constantly register on the Microsd or NAS card. Many users want to record 24 hours a day, 7 days a week, no matter what. You need an application that can do this. A two -frequency sound has a microphone accumulated in some IP frames, and sometimes a speaker. This means that you can hear from the video camera (microphone) and talk to people under the camera (through the speaker's speaker). Some applications support this function, you can download the sound from the video camera and talk to it. Conversations will be held on the radio, but this is especially remarkable for cameras installed at the main gate or entrance. If you need a stable camera with reliability and costs, you need a reliable application for viewing an IP camera. It should be fast, reactive and without delay. The application will work day and night, and your notes should be safe. The last thing you need is an abnormal arrest of the application. In addition, the price should be affordable. And, of course, the three listed applications are very valuable for affordable costs. Of course, free ads, but perhaps they will spend 5-10 dollars for a one-time purchase and enjoy the application. As in everything, you definitely get the person you pay. This is your safety, so it costs a small additional payment. The background recording dreams of using IP cameras as a children's monitor. Do you want the camera application to work on your phone? Of course, you do this, but you need an application that can be done in the background and can record video and sound. No one always wants to be an open application on your phone. Thus, you need a camera application that controls the history of sound and video. Make the settings and allow you to perform the application in the background when performing other things on the phone or blocking the screen. Various quality of the flow, simultaneous resources on a streaming phone from several HD IP cameras can be exhausted. A good browser for applying the camera allows you to switch from high -quality flow to another. For example, you can watch a 1080p video camera, and then move on to a lower quality that your phone can be easier to control. Some applications of the camera automatically select an optimized flow for the phone if you use a 3G/4G mobile network or another connection to a low -speed Internet. This will save the data and better uses the camera. web serverApplications that provide web server support are ideal for setting up home automation. You can configure the IP Camera Viewer to do certain things if they are done by your home automation system. You want the application to include Web API or HTTP. Conclusion If you have different independent cameras and want to view in the app, you should choose IP camera view. These applications automatically establish connections to cameras via ONVIF or RTSP streaming addresses. We've replaced three camera apps that you can use on your Android phone or tablet. You have free version with limited features and numbers with advanced features. Your prices are affordable and great value. It is also a one-time purchase. We recommend the TinyCam app. If you need a complete camera system, we recommend checking out this list of Camera America's best systems. These setups are expensive, but this is a professional camera system that uses an NVR and all footage is stored on internal hard drives. Moves.
