

I'm not robot!

[illegible]

behavior to FragmentStatePagerAdapter within RecyclerView.Adapter: From class RecyclerView.ViewHolder(@NonNull VH holder, int position) This method calls onBindViewAdapter to update the ViewHolder contents with the item at the given position and also sets up some private fields to be used by RecyclerView. final @NonNull VH createViewHolder(@NonNull ViewGroup parent, int viewType) This method calls onCreateViewHolder to create a new ViewHolder and initializes some private fields to be used by RecyclerView. int findRelativeAdapterPosition(int @NonNull RecyclerView.Adapter adapter, @NonNull RecyclerView.ViewHolder viewHolder, int localPosition) Returns the position of the given ViewHolder in the given Adapter. abstract int getItemCount() Returns the total number of items in the data set held by the adapter. int getItemViewType(int position) Return the view type of the item at position for the purposes of view recycling. final @NonNull RecyclerView.Adapter.StateRestorationPolicy getStateRestorationPolicy() Returns when this Adapter wants to restore the state. final boolean hasObservers() Returns true if one or more observers are attached to this adapter. final boolean hasStableIds() Returns true if this adapter publishes a unique long value that can act as a key for the item at a given position in the data set. final void notifyDataSetChanged() Notify any registered observers that the data set has changed. final void notifyItemChanged(int position) Notify any registered observers that the item at position has changed. final void notifyItemChanged(int position, @Nullable Object payload) Notify any registered observers that the item at position has changed with an optional payload object. final void notifyItemInserted(int position) Notify any registered observers that the item reflected at position has been newly inserted. final void notifyItemMoved(int fromPosition, int toPosition) Notify any registered observers that the item reflected at fromPosition has been moved to toPosition. final void notifyItemRangeChanged(int positionStart, int itemCount) Notify any registered observers that the itemCount items starting at position positionStart have changed. final void notifyItemRangeChanged(int positionStart, int itemCount, @Nullable Object payload) Notify any registered observers that the itemCount items starting at position positionStart have changed. final void notifyItemRangeInserted(int positionStart, int itemCount) Notify any registered observers that the currently reflected itemCount items starting at positionStart have been newly inserted. final void notifyItemRangeRemoved(int positionStart, int itemCount) Notify any registered observers that the itemCount items previously located at positionStart have been removed from the data set. final void notifyItemRemoved(int position) Notify any registered observers that the item previously located at position has been removed from the data set. void onBindViewHolder(@NonNull VH holder, int position, @NonNull List payloads) Called by RecyclerView to display the data at the specified position. void onViewDetachedFromWindow(@NonNull VH holder) Called when a view created by this adapter has been detached from its window. void registerAdapterDataObserver(@NonNull RecyclerView.AdapterDataObserver observer) Register a new observer to listen for data changes. void setStateRestorationPolicy(@NonNull RecyclerView.Adapter.StateRestorationPolicy strategy) Sets the state restoration strategy for the Adapter. void unregisterAdapterDataObserver(@NonNull RecyclerView.AdapterDataObserver observer) Unregister an observer currently listening for data changes. Public constructors Public methods public boolean containsItem(long itemId) Default implementation works for collections that don't add, move, remove items. When overriding, also override getItemId public abstract @NonNull Fragment createFragment(int position) Provide a new Fragment associated with the specified position. The adapter will be responsible for the Fragment lifecycle: The Fragment will be used to display an item. The Fragment will be destroyed when it gets too far from the viewport, and its state will be saved. When the item is close to the viewport again, a new Fragment will be requested, and a previously saved state will be used to initialize it. See also setOffscreenPageLimit @Override public long getItemId(int position) Default implementation works for collections that don't add, move, remove items. When overriding, also override containsItem. If the item is not a part of the collection, return NO_ID. Parameters int position Adapter position Returns long stable item id hasStableIds @Override public final void onBindViewHolder(@NonNull FragmentViewHolder holder, int position) Called by RecyclerView to display the data at the specified position. This method should update the contents of the itemView to reflect the item at the given position. Note that unlike android.widget.ListView, RecyclerView will not call this method again if the position of the item changes in the data set unless the item itself is invalidated or the new position cannot be determined. For this reason, you should only use the position parameter while acquiring the related data item inside this method and should not keep a copy of it. If you need the position of an item later on (e.g. in a click listener), use getBindingAdapterPosition which will have the updated adapter position. Override onBindViewHolder instead if Adapter can handle efficient partial bind. Parameters @NonNull FragmentViewHolder holder The ViewHolder which should be updated to represent the contents of the item at the given position in the data set. int position The position of the item within the adapter's data set. @Override public final @NonNull FragmentViewHolder onCreateViewHolder(@NonNull ViewGroup parent, int viewType) Called when RecyclerView needs a new ViewHolder of the given type to represent an item. This new ViewHolder should be constructed with a new View that can represent the items of the given type. You can either create a new View manually or inflate it from an XML layout file. The new ViewHolder will be used to display items of the adapter using onBindViewHolder. Since it will be re-used to display different items in the data set, it is a good idea to cache references to sub views of the View to avoid unnecessary findViewById calls. Parameters @NonNull ViewGroup parent The ViewGroup into which the new View will be added after it is bound to an adapter position. int viewType The view type of the new View. See also getItemViewType onBindViewHolder @Override public final boolean onFailedToRecycleView(@NonNull FragmentViewHolder holder) Called by the RecyclerView if a ViewHolder created by this Adapter cannot be recycled due to its transient state. Upon receiving this callback, Adapter can clear the animation(s) that effect the View's transient state and return true so that the View can be recycled. Keep in mind that the View in question is already removed from the RecyclerView. In some cases, it is acceptable to recycle a View although it has transient state. Most of the time, this is a case where the transient state will be cleared in onBindViewHolder call when View is rebound to a new position. For this reason, RecyclerView leaves the decision to the Adapter and uses the return value of this method to decide whether the View should be recycled or not. Note that when all animations are created by RecyclerView.ItemAnimator, you should never receive this callback because RecyclerView keeps those Views as children until their animations are complete. This callback is useful when children of the item views create animations which may not be easy to implement using an ItemAnimator. You should never fix this issue by calling holder.itemView.setHasTransientState(false); unless you've previously called holder.itemView.setHasTransientState(true). Each View.setHasTransientState(true) call must be matched by a View.setHasTransientState(false) call, otherwise, the state of the View may become inconsistent. You should always prefer to end or cancel animations that are triggering the transient state instead of handling it manually. Parameters @NonNull FragmentViewHolder holder The ViewHolder containing the View that could not be recycled due to its transient state. Returns boolean True if the View should be recycled, false otherwise. Note that if this method returns true, RecyclerView will ignore the transient state of the View and recycle it regardless. If this method returns false, RecyclerView will check the View's transient state again before giving a final decision. Default implementation returns false. @Override public final void onViewRecycled(@NonNull FragmentViewHolder holder) Called when a view created by this adapter has been recycled. A view is recycled when a LayoutManager decides that it no longer needs to be attached to its parent RecyclerView. This can be because it has fallen out of visibility or a set of cached views represented by views still attached to the parent RecyclerView. If an item view has large or expensive data bound to it such as large bitmaps, this may be a good place to release those resources. RecyclerView calls this method right before clearing ViewHolder's internal data and sending it to RecycledViewPool. This way, if ViewHolder was holding valid information before being recycled, you can call getBindingAdapterPosition to get its adapter position. @Override public final @NonNull Parcelable saveState() Saves adapter state @Override public final void setHasStableIds(boolean hasStableIds) Indicates whether each item in the data set can be represented with a unique identifier of type java.lang.Long. Parameters boolean hasStableIds Whether items in data set have unique identifiers or not. See also hasStableIds getItemId

29/01/2021 · Google acknowledges the Fragment API's flaws and is currently working on a solution to consolidate the two lifecycles into a single lifecycle. This solution may be released in the AndroidX Fragment 1.3.0 library. Depending on how they accomplish this, the solution described here may, in time, become obsolete. Static library support version of the framework's android.app.FragmentManager. Used to write apps that run on platforms prior to Android 3.0. When running on Android 3.0 or above, this implementation is still used; it does not try to switch to the framework's implementation. See the framework FragmentManagerdocumentation for a class overview. 30/06/2021 · To create Fragment class, right-click on the first package of java directory which is located at app > java > "com.example.gfgtabdemo", where "gfgtabdemo" is the project name in a small case. Move cursor on " New " and select " Kotlin file/class ". Give " LoginFragment " as a name to that file and select the " class ... 04/11/2016 · MyFragment mFragment = myPagerAdapter.getItem(mViewPager.getCurrentItem()); in this example "myPagerAdapter" is your ViewPager's Adapter. and then you can access public methods and variables of that fragment in your activity class. Full example: code of my Activity which is having ViewPager. 11/05/2020 · Prepare the Android Studio 1. Create a New Project on Android Studio. Choose Empty Activity. 2. Add your file name, then click Finish Add the Dependencies Adding the dependencies for RecyclerView... 18/09/2021 · Adapter Tutorial With Example In Android Studio. In Android, Adapter is a bridge between UI component and data source that helps us to fill data in UI component. It holds the data and send the data to an Adapter view then view can takes the data from the adapter view and shows the data on different views like as ListView, GridView, Spinner etc. For more ... Android FragmentManager getBackStackEntryCount() Return the number of entries currently in the back stack. Syntax The method getBackStackEntryCount() from FragmentManager is declared as: Copy ... //list of tags for saved searches private ArrayAdapter adapter; ... 09/06/2015 · To achieve it, first we get the instance of FragmentTransaction using FragmentManager, then call replace method which will accept view container id and new fragment instance. Finally we commit the fragment transaction. FragmentManager android.app.FragmentManager interacts with Fragment which are within an Activity. Hey man! Thanks a lot for the tutorial, it was really useful and I couldn't find anything else to solve my problem until I found this. I do have a problem though: instead of a single textview, I have multiple, which need to be populated with different strings from an object, however I haven't been able to find a proper way to do that. 15/05/2021 · Step 5: Create an Adapter class Go to the app > java > right click on first package name > new > java class name that class as ViewPager2Adapter. An adapter is an important class to work with RecyclerView. Because it contains all the important methods dealing with RecyclerView. Below is the implementation of the Adapter class.
